Knowledge Discovery Process

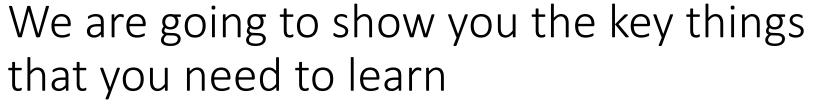

Group F

CRoss Industry **S**tandard Process for Data Mining

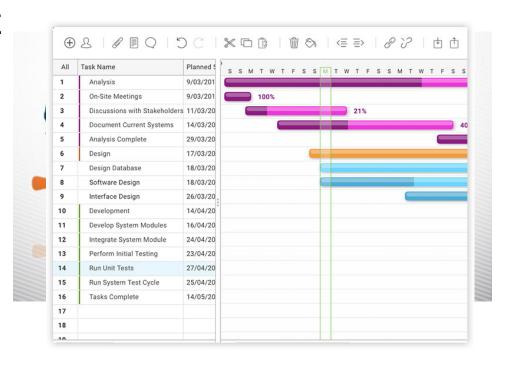

Business understanding phase is all about ie translation to analytical form.

SCHOOL OF HUMAN SCIENCES & TECHNOLOGY

- Understand what the real business problem they want you to solve
- Look for the key players in the game (stakeholders)

 Define the success criteria (KPI)

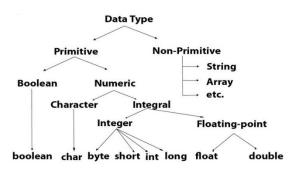

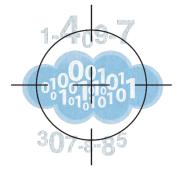

Make a project plan

Data Understanding is the dirty job that no one wants to do

Collect the data:

- What is the right data
- Sources of the data
- Select tables and/fields

Describe the Data:

- Check access to data, volume and complexity
- Understand the meaning of data
- Analyze the relationships

Explore the data:

- Analyze the properties
- Make the first findings
- Get interesting subsets

Verify Quality

- Check keys
- Check data issues (missing, blank, typos, spelling)
- Check special values

Technology Platform: don't overfit your company with platforms

Data Preparation: this is when the action starts

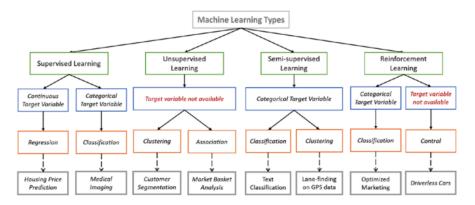

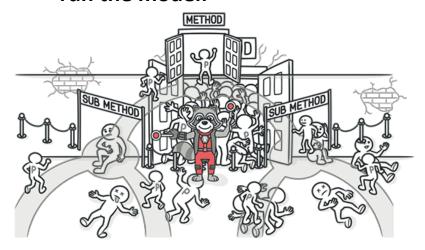

Modeling, start simple and push it forward

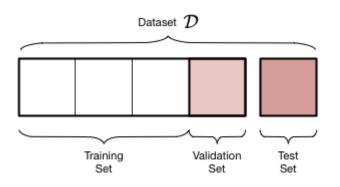

Select the fitting models:

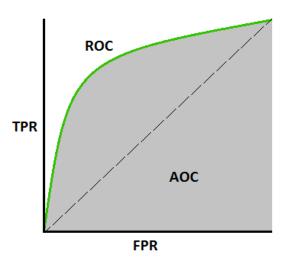

Optimize the Hyperparameters and run the model:

Decide Samples and prepare data:

Assess the model:

Evaluation, time to go back and check on everything you've done before.

Did your model solve the business problem?

Are all the steps necessary?

What are the next steps?

Deployment is to integrate your model into the company structure

Technical Deployment:

- Draw conceptual Model
- Decide on the analytical tool and model integration
- Temporal Planning
- Other systems connections

Business Deployment:

- Decide on the users, key actors for the model
- Produce the full documentation/platforms
- Decide the applicability and threshold of the model
- Plan on monitoring and Maintenance
